Brush and Clean Enters North American Market

Brush and Clean, a global manufacturer of dry carpet and flooring cleaning systems, chemicals, and accessories for building and construction firms worldwide, has announced it has now expanded into North America.

Brush and Clean manufacturers EPA DFE equivalent, low-moisture dry carpet and tile flooring cleaning systems and "green" chemicals that allow builders to now provide "No Drying Time" carpet cleaning and tile solutions. Brush and Clean's equipment uses no motorized vacuums and is designed to be lighter than all available systems on the market today. By its patented smaller size, it requires less manpower to operate, lift and store and doesn't make the noise of most cleaners today — allowing service personnel the ability to clean the flooring without other construction projects or office workers in the area that requires treatment. Areas that most often need cleaning do not need to be closed to traffic.

Brush and Clean's secret dry carpet cleaning formula, Brush & Clean Dry Carpet Cleaning, includes safe and effective non-toxic cleaning agents and is 98% organic. The heart of the cleaning system is Brush & Clean's dry cleaning compound, consisting of renewable natural materials that are free of phosphates, pH-neutral, contain biodegradable active agents and a pleasant fresh fragrance.

NoVac™ Technology

Brush and Clean's equipment uses no motorized vacuums and is designed to be lighter than all available systems on the market today. Unlike most carpet cleaning equipment that requires separate, heavy equipment that soaks the carpet and then leave tracks over the carpet as they clean, Brush and Clean's equipment uses no vacuums and requires no long, obtrusive hoses to be dragged through the construction. It requires less storage, less cleaning of the equipment, less labour to operate and less downtime.
